

This project includes 4 primary pages with multiple sub-components either consistent throughout or providing functionality to a specific page. The main pages are Home, Metrics, Schedule, and Login. Login is accessed through a button in the top right-hand corner and opens a pop-up window that closes once the login is authenticated. Home shows the student name once logged in and has a searchable list of classes that can be dragged and dropped onto the page in tables for each semester. There is also a Change Major pop-up on the right menu that changes the student's major, which shows up under the student name. Underneath in the right side menu are links to useful MyGeneva pages for registration including the full course catalogue. Metrics has a bar graph showing completed and in-progress classes. Schedule shows only courses for a selected semester, with a print button using `window.print()`. Metrics and Schedule used a Pinia store to keep courses consistent with Home. Another page is Students, which was basically a searchable and sortable table. Once that was built and the errors were fixed it mostly stayed as-is.

The project started with a wireframe that changed over the course of the project. The original wireframe did not have drag-and-drop but planned for just typing in courses, until I learned how the API actually worked. Finishing the project required overcoming many errors, such as Pinia and Oruga crashing, many inconsistencies across components, and wrong API calls. Home was the first page built, followed by Login and Metrics. Schedule was very simple to build, mostly based off of Metrics and Home, but diverging primarily in formatting. The final step was building the actual drag-and-drop system to add and remove classes and allowing classes to show up on the Metrics and Schedule pages. I used `vue-draggable-plus` to allow for dragging courses onto the page and dragging them off to remove them.

I learned a lot about how to build a website in this project, and got a lot of practice writing in HTML, CSS, some Javascript (I found it more simple than Typescript, or at least easier to implement), and of course building and managing Vue components and using Pinia with a little bit of Oruga. I look forward to putting some of these skills to use in the future.
